Hosting Features

Tier-1 Redundant Hosting – Your website is hosted at two secure, geographically separated Tier-1 data centers for full redundancy.

Automatic Fail Over – In the event of a failure, your website will fail over to a secondary data center, keeping your website online and accessible. Once the issue is resolved, service will fall back to the primary data center.

Disaster Recovery – All system components are mirrored from the primary data center to the secondary data center to prevent loss via hardware or even facility failure. Full database backups are archived for 14 days and can be restored within minutes.

Optimized Servers – Our servers are finely-tuned for fast, responsive access.

System Monitoring – Our system experts continuously monitor your system and respond quickly and efficiently to any issues.

Software Updates – All system software is kept up-to-date with security patches and stable updates.
